Across

- 5 A protist that has modified mitochondria, two equal-sized nuclei, and multiple flagella .
- 8 One of four supergroups of eukaryotes proposed in a current hypothesis of the evolutionary history of eukaryotes. This clade, which is supported by studies of myosin proteins and DNA, consists of amoebozoans and opisthokonts .
- 10 One of four supergroups of eukaryotes proposed in a current hypothesis of the evolutionary history of eukaryotes. This monophyletic group, which includes red algae, green algae, and plants, descended from an ancient protistan ancestor that engulfed a cyanobacterium. See also Excavata, SAR, and Unikonta .
- 12 A rootlike structure that anchors a seaweed .
- 13 A photosynthetic protist, named for green chloroplasts that are similar in structure and pigment composition to the chloroplasts of plants. Green algae are a paraphyletic group; some members are more closely related to plants than they are to other green algae . (2 Words)
- 15 A stemlike structure of a seaweed .
- 17 A protist, such as a trypanosome, that has a single large mitochondrion that houses an organized mass of DNA .
- 18 A protist in a clade that includes many species with lobe- or tube-shaped pseudopodia .
- 19 A biflagellated, photosynthetic protist named for its color, which results from its yellow and brown carotenoids . (2 Words)
- 21 Referring to alternating generations in plants and certain algae in which the sporophytes and gametophytes look alike, although they differ in chromosome number .
- 23 A member of a group of mostly unicellular photosynthetic algae with two flagella situated in perpendicular grooves in cellulose plates covering the cell .
- 24 One of four supergroups of eukaryotes proposed in a current hypothesis of the evolutionary history of eukaryotes. This supergroup contains a large, extremely diverse collection of protists from three major subgroups ; stramenopiles, alveolates, and rhizarians. See also Excavata, Archaeplastida, and Unikonta .
- 25 An aquatic protist that secretes a hardened shell containing calcium carbonate and extends pseudopodia through pores in the shell .
- 27 An informal term applied to any eukaryote that is not a plant, animal, or fungus. Most protists are unicellular, though some are colonial or multicellular .
- 29 In prokaryotes, the direct transfer of DNA between two cells that are temporarily joined. When the two cells are members of different species, conjugation results in horizontal gene transfer; or in ciliates, a sexual process in which two cells exchange haploid micronuclei but do not reproduce .
- 31 A photosynthetic protist, named for its color, which results from a red pigment that masks the green of chlorophyll. Most red algae are multicellular and marine . (2 Words)
- 32 One of the three major subgroups for which the SAR eukaryotic supergroup is named. Many species in this clade are amoebas characterized by threadlike pseudopodia .
- 33 A protist, such as Euglena or its relatives, characterized by an anterior pocket from which one or two flagella emerge .
- 34 An organism that produces organic compounds from CO₂ by harnessing light energy (in photosynthesis) or by oxidizing inorganic chemicals (in chemosynthetic reactions carried out by some prokaryotes) .
- 35 A process in eukaryotic evolution in which a heterotrophic eukaryotic cell engulfed a photosynthetic eukaryotic cell, which survived in a symbiotic relationship inside the heterotrophic cell . (2 Words)
- 36 A member of an extremely diverse clade of eukaryotes that includes fungi, animals, and several closely related groups of protists .
- 37 One of the three major subgroups for which the SAR eukaryotic supergroup is named. This clade arose by secondary endosymbiosis, and its members have membrane-enclosed sacs (alveoli) located just under the plasma membrane .
- 38 Referring to a condition in the life cycle of plants and certain algae in which the sporophyte and gametophyte generations differ in morphology .

Down

- 1 One of four supergroups of eukaryotes proposed in a current hypothesis of the evolutionary history of eukaryotes. Excavates have unique cytoskeletal features, and some species have an "excavated" feeding groove on one side of the cell body. See also SAR, Archaeplastida, and Unikonta .
- 2 A life cycle in which there is both a multicellular diploid form, the sporophyte, and a multicellular haploid form, the gametophyte; characteristic of plants and some algae . (3 Words)
- 3 An organism that is capable of both photosynthesis and heterotrophy .
- 4 A cellular extension of amoeboid cells used in moving and feeding .
- 6 A multicellular, photosynthetic protist with a characteristic brown or olive color that results from carotenoids in its plastids . Most species are marine, and some have a plantlike body . (2 Words)
- 7 In foram protists, a porous shell that consists of a single piece of organic material hardened with calcium carbonate .
- 9 A leaflike structure of a seaweed that provides most of the surface area for photosynthesis; or the flattened portion of a typical leaf .
- 11 A protist characterized by the presence of pseudopodia .
- 14 A group of alveolate protists, this clade includes many species that parasitize animals. Some apicomplexans cause human disease .
- 16 A protist, usually marine, with a shell generally made of silica and pseudopodia that radiate from the central body .
- 20 A general term for any species of photosynthetic protist, including both unicellular and multicellular forms.
- 22 A protist, such as a trichomonad, with modified mitochondria .
- 23 Photosynthetic protist in the stramenopile clade; diatoms have a unique glass-like wall made of silicon dioxide embedded in an organic matrix .
- 24 One of the three major subgroups for which the SAR eukaryotic supergroup is named. This clade arose by secondary endosymbiosis and includes diatoms and brown algae .
- 26 A relationship between two species in which one organism lives inside the cell or cells of another organism. See also endosymbiont theory .
- 28 A member of a diverse clade of flagellated protists that includes predatory heterotrophs, photosynthetic autotrophs, and pathogenic parasites .
- 30 An amoeboid or flagellated protist that feeds with threadlike pseudopodia .
